

Ventilation System Guide

Astra Range

Heat Recovery Ventilation System

What is it and why is it there?

A centralised fan unit mounted in your loft space or cupboard that draws stale moist air and odours from your bathroom, kitchen and WC removing it from the property through the circular grilles mounted in your ceiling.

What does it do?

It continuously moves air around your property at such a low level that you hardly feel it, but it takes all the stale air from inside your house and replaces it with clean fresh air, 24 hours a day, 7 days a week.

Your home is ventilated without the need to open windows which can let in noise and fumes and can compromise security.

How will it help?

It will prevent the build up of moisture in the house, remove steam/condensation and odours during bathing and cooking, prevent black mould forming on the walls or behind cupboards etc. It will also help stop the dampness that you can get in your cupboards and wardrobes, on your clothes and furnishings, caused by poor ventilation.

How do I control it?

On normal setting your Astra operates continuously to ensure your home is ventilated at the appropriate level. The system can be boosted to a higher speed using the manual boost control, for example on a hot day.

Running cost

Your Astra uses the latest low energy technology and can cost as little as £15.00* per annum to run. The heat exchanger recovers more energy than the unit consumes so the Astra will actually save you money. *Based on electricity at 13pence per unit.

DO NOT...

...switch off the unit

The unit is set to run continuously 24 hours a day, 7 days a week.

...adjust the ceiling grilles

These grilles are set to allow a certain amount of air through and may affect performance if adjusted.
